George Stephenson

George Stephenson

Engineer and inventor

Born	9 June 1781 Wylam, Northumberland, England
Died	12 August 1848 (aged 67) Tapton House, Chesterfield, Derbyshire, England
Resting place	Holy Trinity Church, Chesterfield
Nationality	English
Spouse(s)	Frances Henderson (1802–1806) Elizabeth Hindmarsh (1820–1845) Ellen Gregory (1848)
Children	Robert Stephenson Frances Stephenson (died in infancy)

Bron: wikipedia

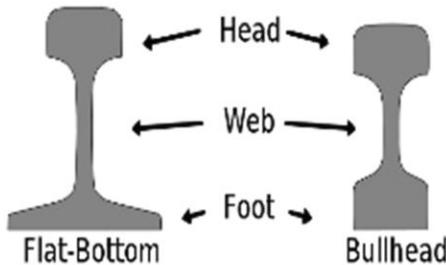

Standaard spoorbreedte: 1435 mm

Stephenson's gauge

INTEROPERABILITY (TRACK GAUGES)

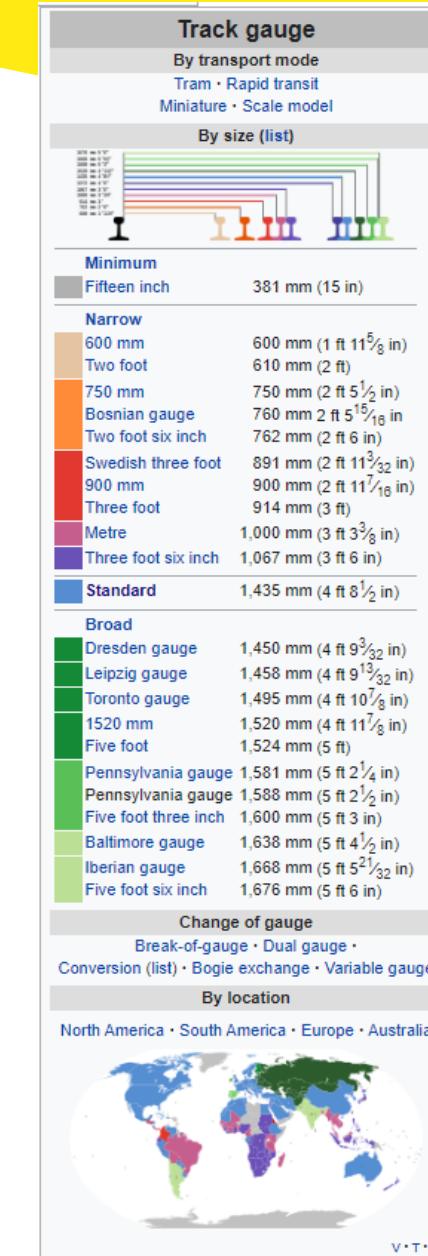

Track gauge is a technical term used in railways to define the spacing of the rails in an individual railway track.

It is the dominant parameter determining interoperability.

Broad gauge		
Brunel	2,140 mm (7 ft. 1/4 in)	
Indian	1,676 mm (5 ft. 6 in)	
Iberian	1,668 mm (5 ft. 5 2/3 in)	
Irish	1,600 mm (5 ft. 3 in)	
Russian	1,520 mm (4 ft. 11 5/8 in)	
Standard gauge (Stephenson)		
standard	1,435 mm (4 ft. 8 1/2 in)	
Medium gauge		
Scotch	1,372 mm (4 ft. 6 in)	
Cape	1,067 mm (3 ft. 6 in)	
Meter	1,000 mm (3 ft. 3 3/8 in)	
Narrow gauge		
Three foot	914 mm (3 ft.)	
Swedish three foot	891 mm (2 ft. 11 1/10 in)	
Imperial	762 mm (2 ft. 6 in)	
Bosnian	760 mm (2 ft. 5 15/16 in)	
Minimum gauge		
Fifteen inch	381 mm (15 in)	

47

Global Trade Item Number

From Wikipedia, the free encyclopedia

This article **needs additional citations for verification**. Please help [improve this article](#) by adding citations to reliable sources. Unsourced material may be challenged and removed.

Find sources: "Global Trade Item Number" – news · newspapers · books · scholar · JSTOR (February 2017) (Learn how and when to remove this template message)

The Global Trade Item Number (GTIN) is an identifier for trade items, developed by GS1.^[1] Such identifiers are used to look up product information in a database (often by entering the number through a barcode scanner pointed at an actual product) which may belong to a retailer, manufacturer, collector, researcher, or other entity. The uniqueness and universality of the identifier is useful in establishing which product in one database corresponds to which product in another database.

ITF-14

From Wikipedia, the free encyclopedia

ITF-14 is the GS1 implementation of an Interleaved 2 of 5 (ITF) bar code to encode a Global Trade Item Number. ITF-14 symbols are generally used on packaging levels of a product, such as a case box of 24 cans of soup. The ITF-14 will always encode 14 digits.

The GS1 GEPIR tool can be used to find out the company identification for a given GTIN-14 that is encoded in an ITF-14 Symbol.

The thick black border around the symbol is called the Bearer Bar. The purpose of a Bearer Bar is to equalise the pressure exerted by the printing plate over the entire surface of the symbol, and to enhance reading reliability by helping to reduce the probability of misreads or short scans that may occur when the scanner is held to a bar code at too large an angle. Such instances of skewed scanning cause the scanning beam to enter or exit the bar code symbol through the Bearer Bar at its top or bottom edge, forcing the scanner to detect an invalid scan since Bearer Bars are much wider than a legitimate black bar.

History of the World Wide Web

From Wikipedia, the free encyclopedia

Web history redirects here. For the feature of web browsers, see Web browsing history.

The World Wide Web ("WWW"), not to be confused with the "web", is a global information medium which users can access via computers connected to the Internet. The term is often mistakenly used as a synonym for the Internet itself and often called "the Internet", but the Web is a service that operates over the Internet, just as email (also e-mail) and Usenet also do. The history of the Internet dates back significantly further than that of the World Wide Web.

Precursors [edit]

The hypertext portion of the Web in particular has an intricate intellectual history; notable influences and precursors include Vannevar Bush's Memex,^[2] IBM's Generalized Markup Language,^[4] and Ted Nelson's Project Xanadu.^[3] Paul Otlet's Mundaneum project has also been named as an early 20th-century precursor of the Web.^[5]

The concept of a global information system connecting homes is prefigured in "A Logic Named Joe", a 1946 short story by Murray Leinster, in which computer terminals, called "logics", are present in every home. Although the computer system in the story is centralized, the story anticipates a ubiquitous information environment similar to the Web. The cultural impact of the Web was imagined even further back in a short story by E. M. Forster, "The Machine Stops", first published in 1909.

1980–1991: Invention and implementation [edit]

In 1980, Tim Berners-Lee, an English independent contractor at the European Organization for Nuclear Research (CERN) in Switzerland, built ENQUIRE, as a personal database of people and software models, but also as a way to play with hypertext; each new page of information in ENQUIRE had to be linked to a page.^[3]

Berners-Lee's contract in 1980 was from June to December, but in 1984 he returned to CERN in a permanent role, and considered its problems of information management: physicists from around the world needed to share data, yet they lacked common machines and any shared presentation software.

Shortly after Berners-Lee's return to CERN, TCP/IP protocols were installed on some key non-Unix machines at the institution, turning it into the largest Internet site in Europe within a few years. As a result, CERN's infrastructure was ready for Berners-Lee to create the Web.^[6]

Berners-Lee wrote a proposal in March 1989 for "a large hypertext database with typed links".^[7] Although the proposal attracted little interest, Berners-Lee was encouraged by his boss, Mike Sendall, to begin implementing his system on a newly acquired NeXT workstation.^[8] He considered several names, including Information Mesh,^[7] The Information Mine or Mine of Information, but settled on World Wide Web.^[9]

World Wide Web Consortium

From Wikipedia, the free encyclopedia
(Redirected from W3c)

'WWWC' redirects here. For the radio station, see [WWWC \(AM\)](#).

The World Wide Web Consortium (W3C) is the main international standards organization for the World Wide Web. Founded in 1994 and currently led by Tim Berners-Lee, the consortium is made up of member organizations that maintain full-time staff working together in the development of standards for the World Wide Web. As of 21 October 2019, W3C had 443 members.^{[3][2]} W3C also engages in education and outreach, develops software and serves as an open forum for discussion about the Web.

History [edit]

The World Wide Web Consortium (W3C) was founded in 1994 by Tim Berners-Lee after he left the European Organization for Nuclear Research (CERN) in October, 1994. It was founded at the Massachusetts Institute of Technology Laboratory for Computer Science (MIT/LCS) with support from the European Commission, the Defense Advanced Research Projects Agency (DARPA), which had pioneered the ARPANET, one of the predecessors to the Internet.^[3] It was located in Technology Square until 2004, when it moved, with CSAIL, to the Stata Center.^[4]

The organization tries to foster compatibility and agreement among industry members in the adoption of new standards defined by the W3C. Incompatible versions of HTML are offered by different vendors, causing inconsistency in how web pages are displayed. The consortium tries to get all those vendors to implement a set of core principles and components which are chosen by the consortium.

Druktemetingen

Waarom standaardiseren? Marktcreatie!

Vraagzijde: steden en gemeenten

- Modulaire, herbruikbare onderdelen
- Combineren over leveranciers heen
- Vrijheid in het samenstellen van oplossingen

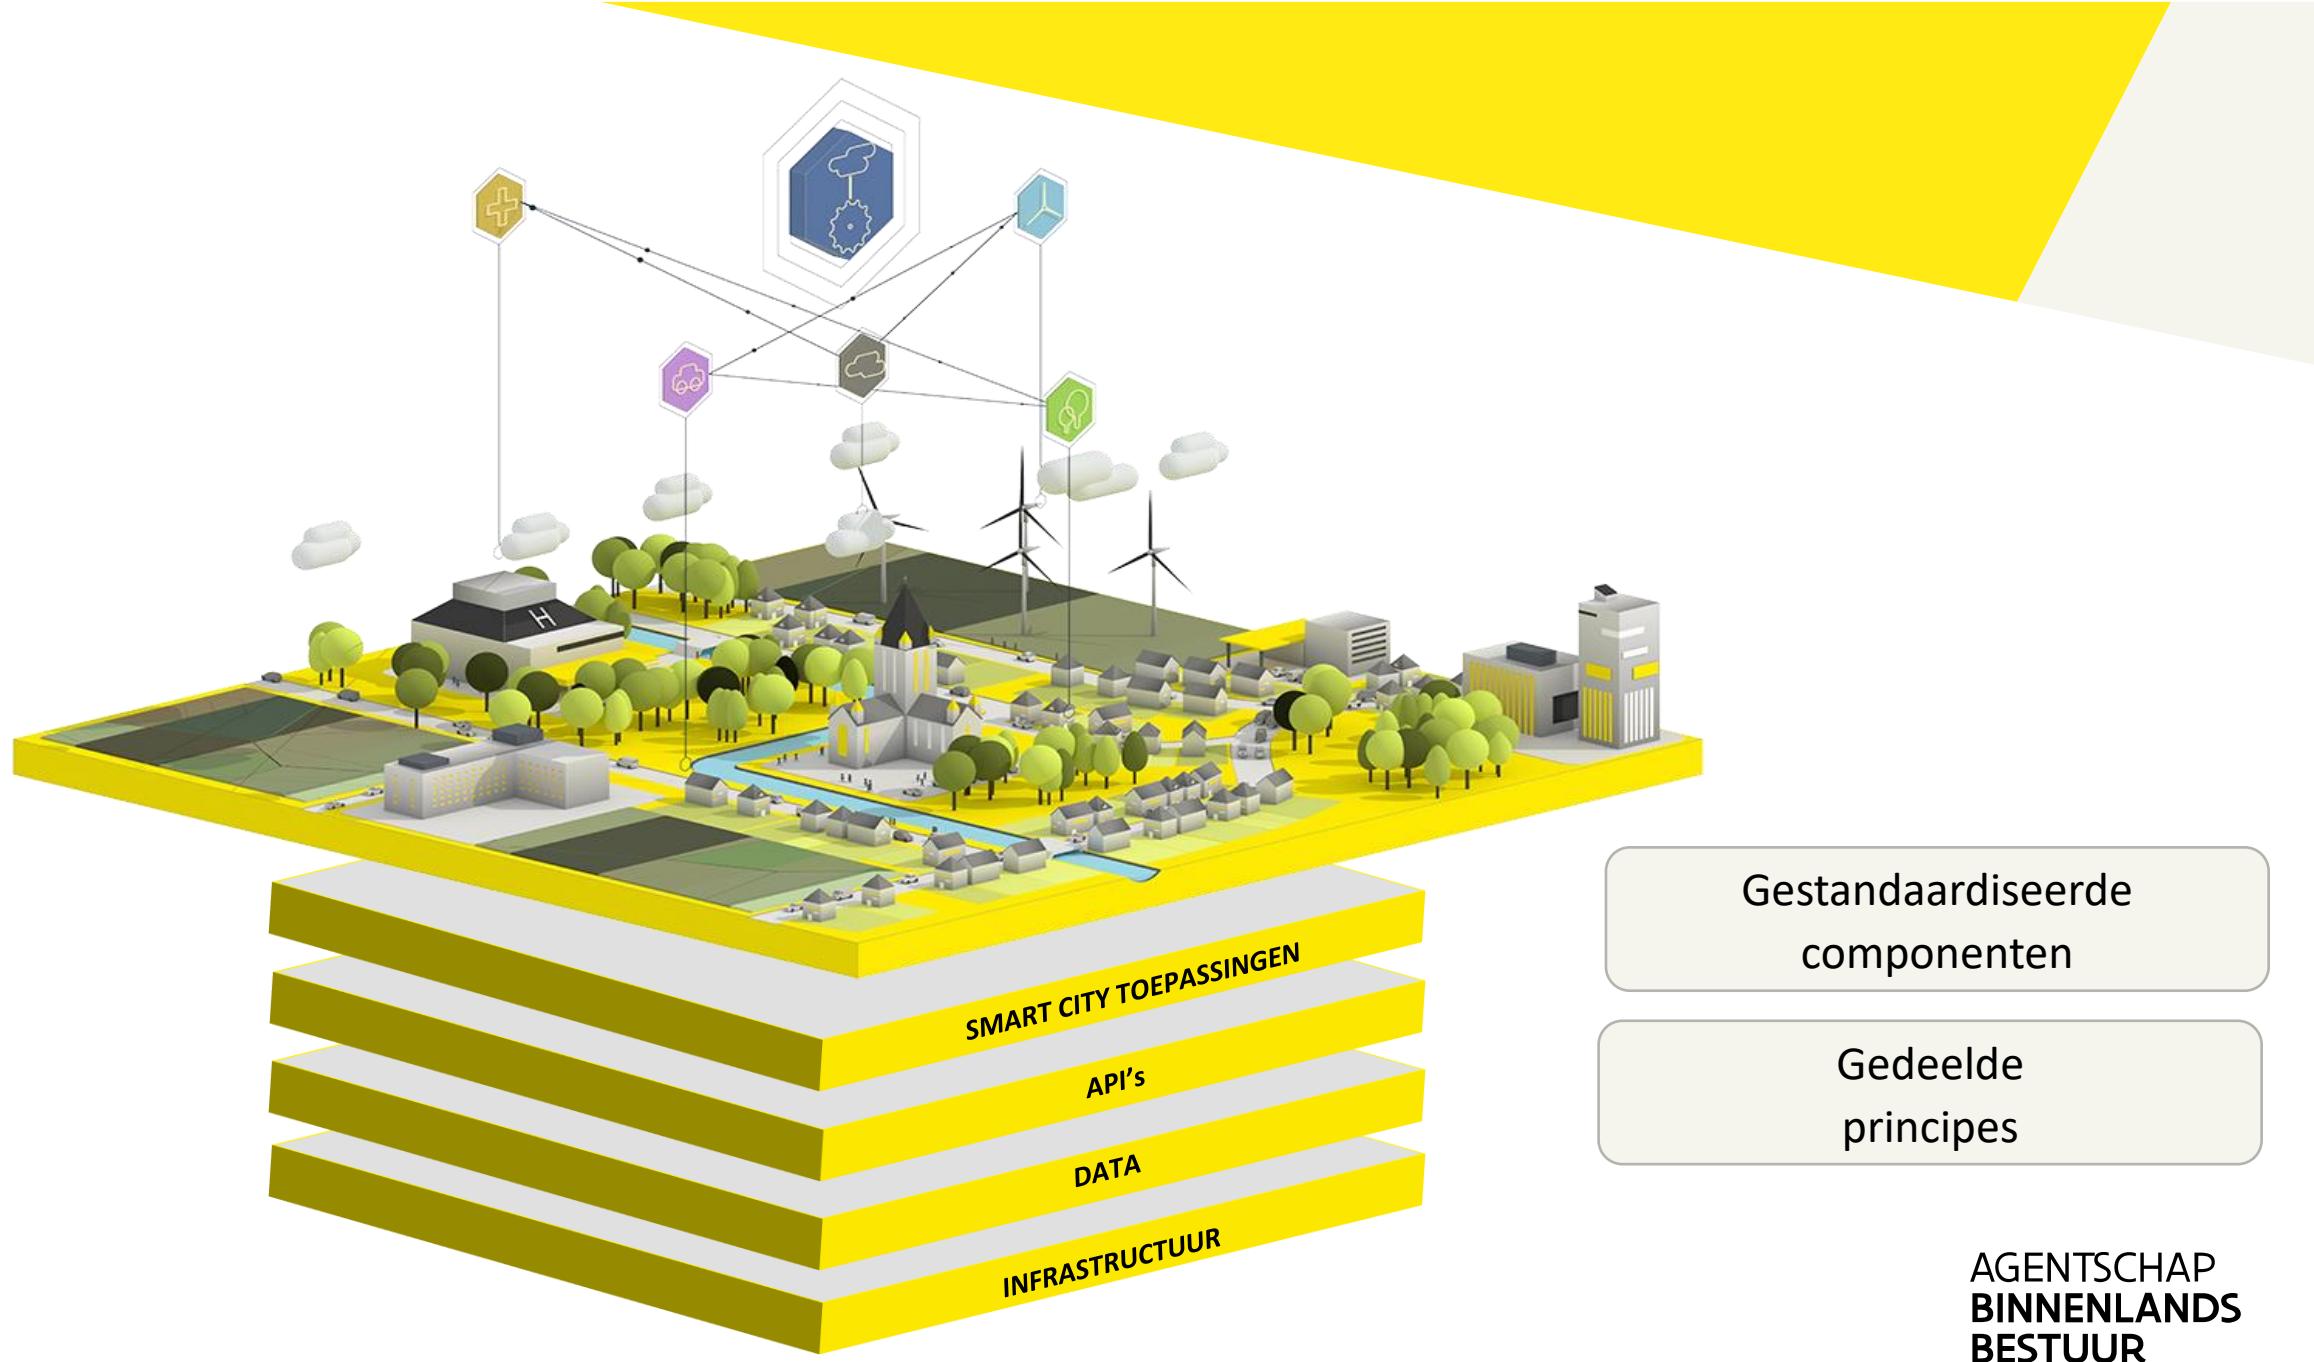

Aanbodzijde: standaardcomponenten

- Kleinere modules, kleinere investeringen
- Integratie met producten van andere leveranciers
- Meer concurrentie zorgt voor meer mature markt

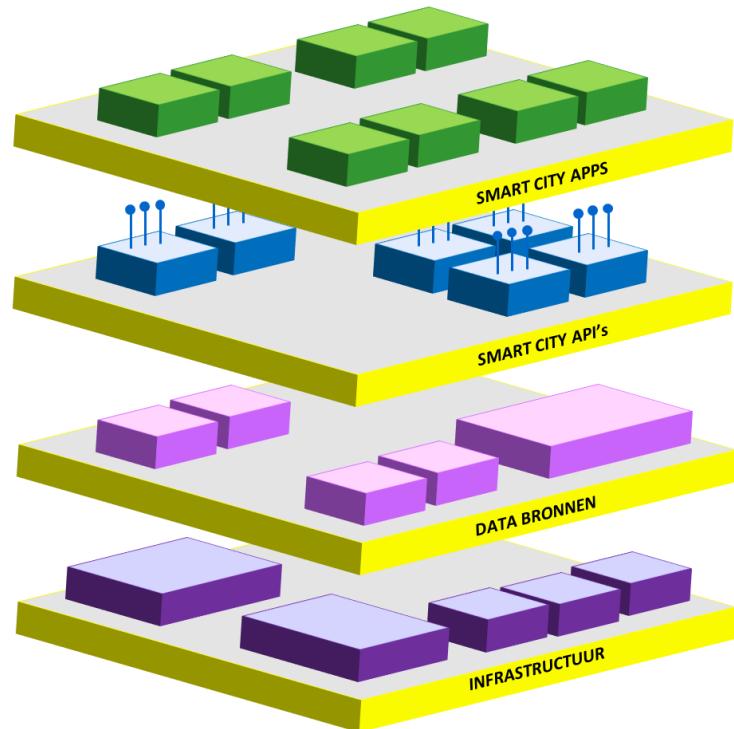

Hoe gemeenschappelijke standaarden afspreken?

- Co-creatie steden en gemeenten, burgers, bedrijven en kennisinstellingen via VLOCA kennishub.

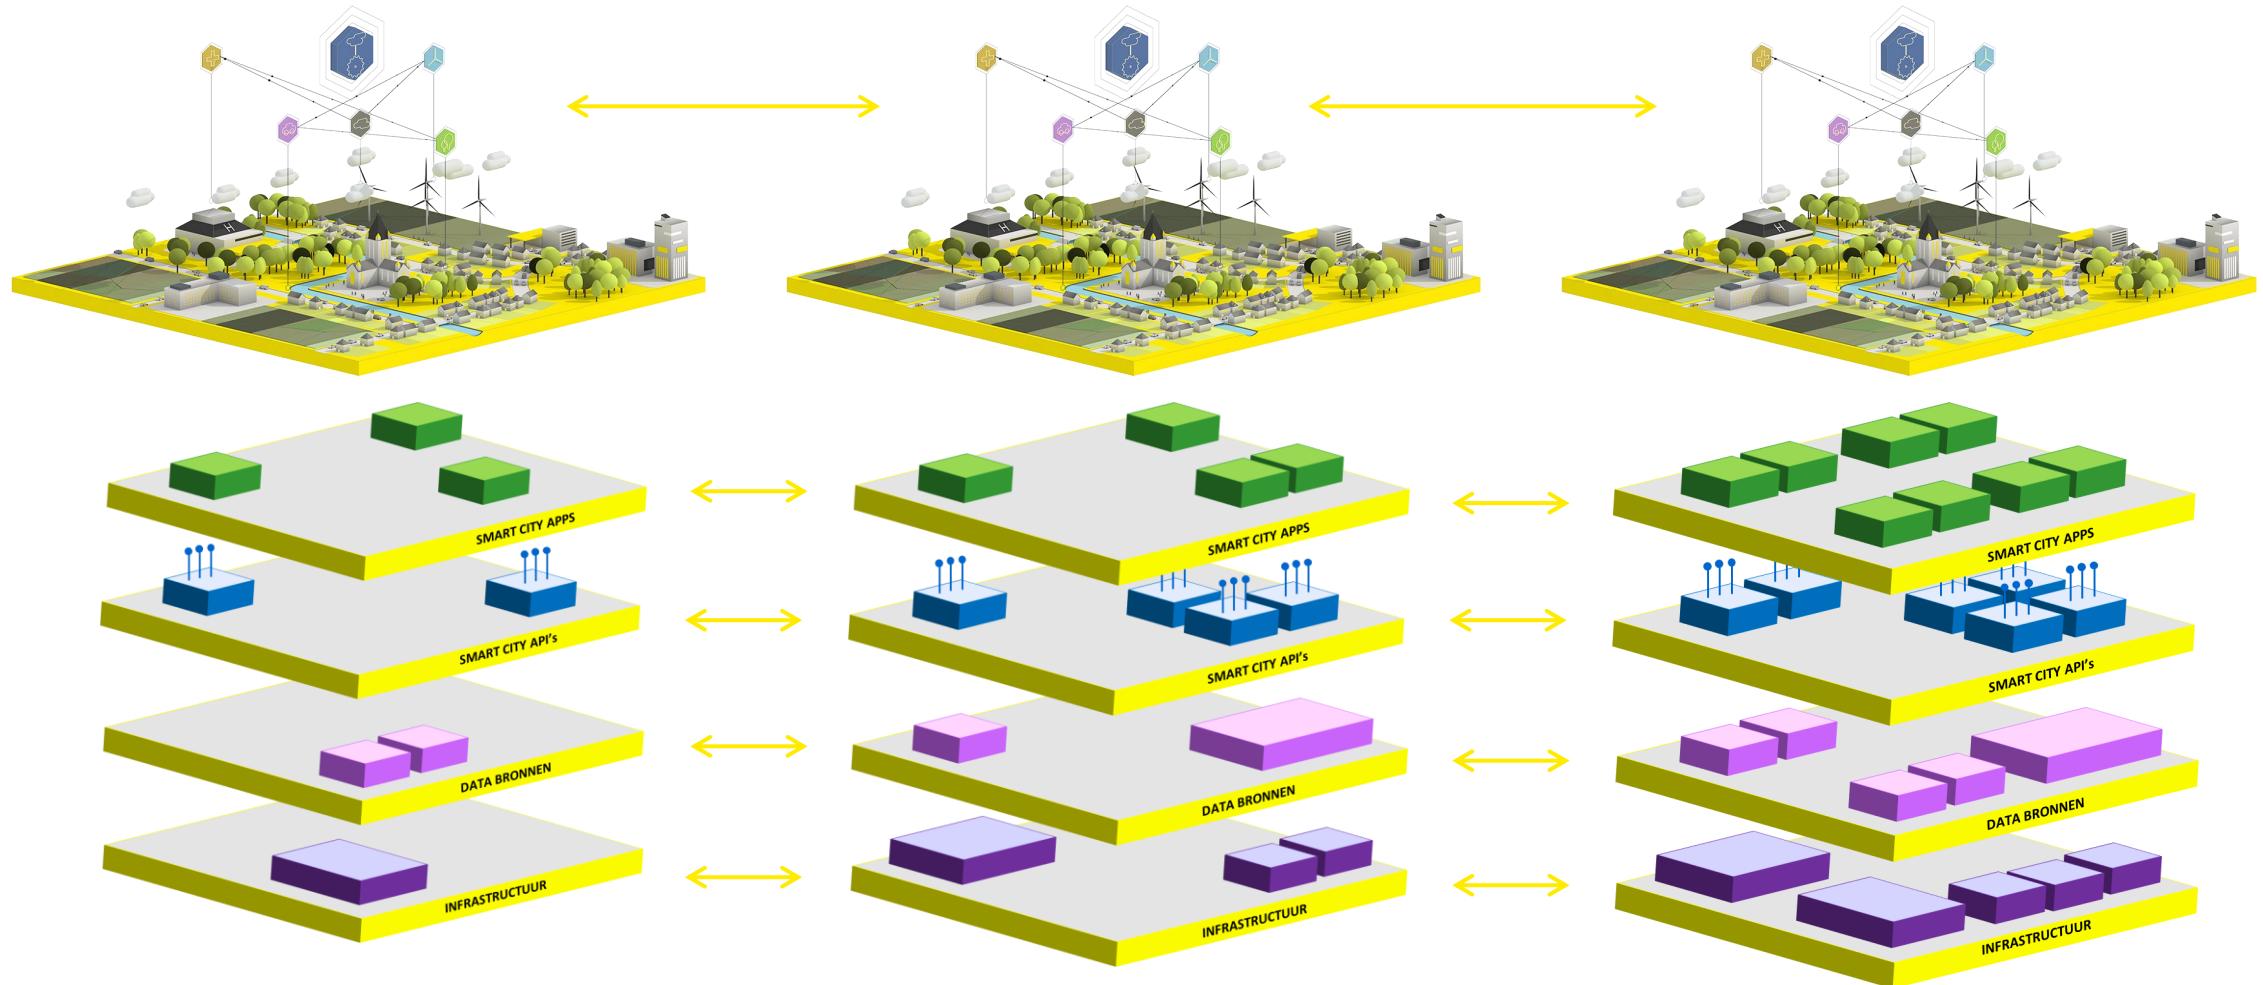

Selecteer Smart City bouwstenen die voldoen aan VLOCA standaarden

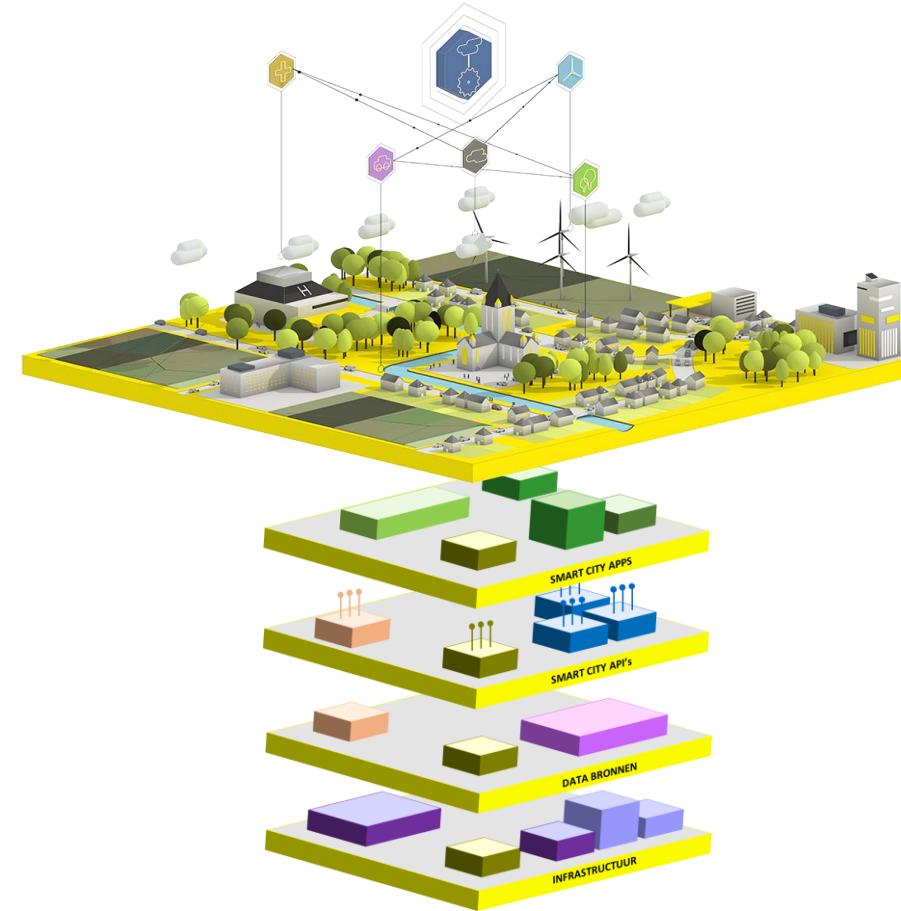

Bouw je eigen smart city

op maat van je lokaal bestuur

Smart City leveranciers

Welkom bij de Vlaamse Open City Architectuur Kennishub

Wat wil VLOCA bereiken ? [edit]

VLOCA verenigt burgers, kenniscentra, de bedrijfswereld, lokale en provinciale besturen, Vlaamse overheidsagentschappen en koepelorganisaties om het referentiekader voor een open city architectuur te co-creëren, bestaande uit technologische standaarden en afspraken die in VLOCA in samenwerking tot stand komen. Het doel van VLOCA is om dit referentiekader concreet te gebruiken om projecten te realiseren op maat van initiatiefnemende steden en gemeenten, door middel van draaiboeken. Deze technische draaiboeken geven aan welke processen de stad of gemeente doorloopt en hoe de open smart city op basis van real-time data samenwerkt met bestaande en toekomstige digitale infrastructuur, naadloos geconecteerd met elkaar.

Hoe willen we dit aanpakken ? [edit]

Verwachtingen van de VLOCA co-creatie op maat van alle deelnemers

- Co-creatie van standaarden zoals de voorbeelden in deze presentatie:

- Actieve kennisdeling: technisch en beleidsmatig in werkgroepen
- Kosten neutraal
- Aandacht voor de kleintjes én de groten, voor verschillende expertiseniveaus
- Uitbouw VLOCA werking op basis van de concrete inbreng van cases
- Prioriteit gebaseerd op draagvlak en relevantie
- Een cocreatie facilitator per thema toegewezen
